Pocket Smart AI – Your Smart Budget Recommendations Assistant

Project Title	Pocket Smart AI – Your Smart Budget Recommendations Assistant
College Name	Shri Krishnaswamy College for Women
College Code	1659
Team ID	SWTID-2026-5516
Team Size	4
Team Leader	Maimoon Siffa K
Team Member	Yasitha Singh D
Team Member	Rakshaana J
Team Member	Ravula Sri Gayathri

INTRODUCTION

Pocket Smart AI is an intelligent budget recommendation assistant designed to help individuals manage their personal finances in a simple, organized, and effective way. Managing daily expenses can be difficult when people have multiple spending needs such as food, transportation, education, shopping, entertainment, and other personal expenses. Pocket Smart AI aims to make budgeting easier by helping users understand their spending patterns and make better financial decisions.

The system allows users to enter important financial information such as their monthly income, expenses, savings goals, and spending categories. Based on the information provided, the application analyzes the user's budget and provides suitable recommendations. It can help users identify areas where they may be spending more and suggest ways to organize their available money more efficiently.

The main objective of Pocket Smart AI is to provide personalized budget recommendations rather than simply displaying financial information. The system can categorize expenses, calculate remaining balances, track spending, and provide suggestions related to saving and budgeting. By presenting information in an easy-to-understand manner, users can get a clearer picture of their financial situation.

Artificial Intelligence can be used to analyze spending information and generate recommendations according to the user's financial patterns. For example, if a user regularly spends a large portion of their income on a particular category, the system can highlight that category and provide a budgeting suggestion. Similarly, users can set specific savings goals and monitor their progress over time.

Pocket Smart AI is designed with simplicity, accessibility, and user-friendliness in mind. The interface can provide clear dashboards, expense summaries, budget limits, and recommendation sections so that users can easily understand their financial information. The system can also help users maintain financial discipline by encouraging planned spending and regular saving.

The project is particularly useful for students, young professionals, and individuals who are beginning to manage their own finances. Students can use it to monitor pocket money and daily

expenses, while working individuals can use it to organize monthly income, expenses, and savings. The system can therefore serve as a practical digital assistant for everyday budgeting. Overall, Pocket Smart AI – Your Smart Budget Recommendations Assistant aims to combine budgeting concepts with Artificial Intelligence to create a smart and convenient financial management solution. By analyzing user-provided financial data and presenting meaningful recommendations, the system can help users understand their spending habits, plan their budgets, work toward savings goals, and develop better financial management practices.
